# Preamble

This weekly report for the British Columbia Energy Regulator (BCER) Waste Discharge Permit (BCER number PE-110163) for the FortisBC Eagle Mountain – Woodfibre Gas Pipeline (EGP) Project includes the results of water quality monitoring and sampling of the receiving environments (upstream and downstream) and points of discharge during the reporting period.

FortisBC has retained Hatfield Consultants as the Qualified Professional to implement and oversee the monitoring and sampling programs. The data represented below, including laboratory reported exceedances, represent conditions measured from final discharge points and the associated receiving environments, as required under the Waste Discharge Permit.

# Introduction

The results provided in this document have been submitted to BCER by FortisBC as per the requirements listed in Section 4.2 of the Waste Discharge Permit PE-110163:

> The Permittee shall summarize the results of the discharge and receiving environment compliance sampling and monitoring program in a report that shall be submitted weekly over the term of this permit. The sampling and monitoring results shall be suitably tabulated and include comparison to the respective British Columbia Approved and Working Water Quality Guidelines for Freshwater & Marine Aquatic Life, as published by the Ministry of Environment & Climate Change Strategy. Any exceedance of regulatory guidelines shall be clearly highlighted, and any missed sampling events/missing data shall be identified with an explanation provided. Reporting frequency may be reduced upon a history of compliance and by written confirmation from the BCER. These reports shall be submitted to Waste.Management@bc-er.ca. A copy of the reports shall be provided to each First Nation consulted with regarding the subject permit, and also made publicly available on the FortisBC Eagle Mountain-Woodfibre Gas Pipeline Project | Talking Energy webpage.

## Sampling Methodology

The monitoring and sampling has been carried out in accordance with the procedures described in the most recent edition of the “British Columbia Field Sampling Manual” using field equipment and laboratory samples to meet daily and real-time requirements for the Waste Discharge Permit.

In the receiving environments, real-time and daily readings were monitored at the same time with one piece of equipment, allowing real-time daily readings. Visible sheen was monitored through visual inspections during times of discharge or sampling.

At the point of discharges, parameters are monitored using field equipment and water quality sondes, as well as discrete weekly water quality sampling events for laboratory analyses. Table 1 and Table 2 below describe this monitoring.

## September 2026 BC Chronic Guideline Comparison

Consistent with recommendations outlined in Hatfield (2024)[1], the applicable guideline at the WLNG EOP is the short-term freshwater guideline for protection of aquatic life. Additionally, as outlined in Hatfield (2024), an assessment is provided below in figures detailing trends in concentrations of constituents determined to exceed monthly average BC chronic water quality guidelines for the protection of aquatic life during at least one weekly sampling event in September at the WLNG DS station. Given that chronic BC WQGPAL are designed to be applied over a monthly period and include conservative assumptions in their derivation (e.g., safety factors), the below interpretation is provided to put these identified exceedance events into context from an ecological risk perspective. A summary of the September monthly chronic guideline comparisons are provided in Table 7.

### Total Aluminum (T-Al) and Dissolved Aluminum (D-Al)

- The mean monthly T-Al concentration at the downstream WLNG DS (0.0895 mg/L) station was above the mean sample-specific calculated BC long-term (LT) WQGPAL (freshwater) of 0.0759 mg/L by a factor of 1.2 times (See Figure 1); however, it met the T-Al Federal WQG of 0.228 mg/L, suggesting limited risk to aquatic life. The Federal WQG was developed using a robust species sensitivity distribution involving IC10 (inhibitory concentration eliciting a 10% effect) values from sensitive aquatic species (reproduced in Figure 5). The BC WQGPAL was derived by applying a 3-fold safety factor to the Federal WQG based on conservative BC WQG development policies; however, as outlined in Section 4.4.6 of BC ENV (2023)[2] Protocol 1 *Detailed Risk Assessment* guidance, risk to aquatic life should be evaluated based on EC20 values. Given that the federal WQG was derived using the 5$^{th}$ percentile from a species sensitivity distribution approach that involved the use of IC10 values, the lack of exceedances of the Federal WQGs at WLNG DS suggests limited risk to aquatic life in East Creek during the month of September.
- It should also be acknowledged that most of the aluminum from WLNG DS was particulate aluminum, which would be expected to be less bioavailable to aquatic life. The mean dissolved aluminum concentration measured at WLNG DS was 0.0509 mg/L, which remained less than both the conservative BC WQGPAL and the federal WQG (See Figure 2). Therefore, these results suggest low risk to downstream aquatic life from the WLNG DS T-Al and D-AL mean concentrations determined for the month of September 2026.

### Total Copper (T-Cu)

- The mean monthly T-Cu concentrations at the WLNG EOP (0.000636 mg/L) and downstream WLNG DS (0.00071 mg/L) stations were both below the mean BC LT WQGMAL (Marine) of 0.002 mg/L for the month of September (See Figure 3).

[2] [BC ENV] British Columbia Ministry of Environment and Climate Strategy. 2023. Protocol 1 for Contaminated Sites. Detailed Risk Assessment. Version 4.0. Date: March 20, 2023.

- The mean T-Cu concentration at the upstream WLNG US (0.00133 mg/L) station was below the mean BC LT WQGMAL (Marine) of 0.002 mg/L, and above the mean monthly T-Cu concentrations at WLNG EOP (0.000636 mg/L) and downstream WLNG DS (0.00071 mg/L) stations, indicating elevated background conditions.
- These results suggest negligible additional risk to downstream aquatic life from the WLNG DS T-Cu mean concentration for the month of September 2026 given that it was less than the mean upstream reference result and below the BC WQGMAL.

### Dissolved Copper (D-Cu)

- The mean monthly D-Cu concentration at the downstream WLNG DS (0.000667 mg/L) station was above the mean sample-specific calculated (i.e., based on WLNG DS water quality) BC LT WQGPAL (freshwater) of 0.000318 mg/L by a factor of 2 times for the month of September (See Figure 4).
- The mean D-Cu concentration at the upstream WLNG US (0.00127 mg/L) station was above the mean sample-specific calculated (i.e., based on WLNG US water quality) BC LT WQGPAL (freshwater) of 0.00036 mg/L by a factor of 3.5 times, indicating elevated background conditions.
- The mean monthly D-Cu concentrations at the WLNG EOP (0.0000828 mg/L) station was below the mean sample-specific calculated (i.e., based on WLNG EOP water quality) BC LT WQGPAL (freshwater) of 0.000226 mg/L for the month of September.
- These results suggest negligible additional risk to downstream aquatic life from the WLNG DS D-Cu mean concentration for the month of September 2026 given that it was less than the mean upstream reference result.

[1] Guideline calculated using the in-situ measurements (pH (field),Temperature (field), Turbidity (field), Hardness (as $CaCO_3$) – total, Dissolved Organic Carbon (DOC), Total Alkalinity ($CaCO_3$), and Chloride).

[2] Guideline values presented represent the lower of the co-factor dependent guidelines for the upstream and downstream stations when they differ, but exceedance bolding is dependent on guidelines calculated using in situ co-factor considerations.

[3] **Bold text** denotes value exceeding guidelines, except in cases where they are below a station-specific guideline that isn't displayed as per [1] and [2] above. Given that application of chronic BC water quality guidelines for protection of aquatic life in the receiving environment downstream of the discharge does not represent a regulatory requirement and instead data are intended to be assessed relative to monthly average concentrations, exceedances of these guidelines are highlighted for information purposes, but detailed interpretation of guideline exceedances are not provided given that an interpretation of monthly trends and consideration of background influences and discharge chemistry is required.

[4] **Bold and shaded text** outlines a reportable exceedance given that it exceeds the applicable BC water quality guideline (i.e., the short-term acute freshwater aquatic life guideline), or discharge concentration limit, consistent with recommendations outlined in Hatfield (2024).

[1] Guideline calculated using the in-situ measurements (pH (field),Temperature (field), Turbidity (field), Hardness (as $CaCO_3$) – total, Dissolved Organic Carbon (DOC), Total Alkalinity ($CaCO_3$), and Chloride).

[2] Guideline values presented represent the lower of the co-factor dependent guidelines for the upstream and downstream stations when they differ, but exceedance bolding is dependent on guidelines calculated using in situ co-factor considerations.

[3] **Bold text** denotes value exceeding guidelines, except in cases where they are below a station-specific guideline that isn't displayed as per [1] and [2] above. Given that application of chronic BC water quality guidelines for protection of aquatic life in the receiving environment downstream of the discharge does not represent a regulatory requirement and instead data are intended to be assessed relative to monthly average concentrations, exceedances of these guidelines are highlighted for information purposes, but detailed interpretation of guideline exceedances are not provided given that an interpretation of monthly trends and consideration of background influences and discharge chemistry is required.

[4] **Bold and shaded text** outlines a reportable exceedance given that it exceeds the applicable BC water quality guideline (i.e., the short-term acute freshwater aquatic life guideline), or discharge concentration limit, consistent with recommendations outlined in Hatfield (2024).

## 1. Executive Summary and Field Notes:

Parameters, including temperature, NTU, pH, DO, salinity, conductivity, and oxidation-reduction potential (ORP), were monitored throughout the reporting period.

On September 29th at 00:15 a temperature reading of 19.6°C was recorded on the Check Point 2 Water Treatment Plant (CP2 WTP) data log. The reading was recorded during low flow and water was not being pushed through the slip stream where the temperature probe is stationed. Stagnant water at the probe warmed up while the plant was idle. When the discharge pump turned on and water passed through the slip stream and past the temperature sensor, the temperature readings returned to values <19°C. The temperature of the water discharged was ~12.6°C

Between September 28th and October 2nd there were 8 conductivity readings of 0 uS/cm recorded on the CP2 WTP data logs. These readings were recorded during low flows, and water was not contacting the conductivity probe.

No visible sheen was observed on the surface of the Portal Water Treatment Plant (PWTP) and CP2 WTP tanks or in the discharged water. All relevant parameters were measured using YSI instruments, Hanna NTU meters and WTP NTU, pH, conductivity and temperature probes.

CP2 WTP received ~291 GPM (1.10 $m^3$/min) and the PWTP received ~180 GPM (0.68 $m^3$/min) from the tunnel.

The total discharge volume up to October 4th was 1,832,127 $m^3$.

[1] Guideline calculated using the in-situ measurements (pH (field),Temperature (field), Turbidity (field), Hardness (as $CaCO_3$) – total, Dissolved Organic Carbon (DOC), Total Alkalinity ($CaCO_3$), and Chloride).

[2] Guideline values presented represent the lower of the co-factor dependent guidelines for the upstream and downstream stations when they differ, but exceedance bolding is dependent on guidelines calculated using in situ co-factor considerations.

[3] **Bold text** denotes value exceeding guidelines, except in cases where they are below a station-specific guideline that isn't displayed as per [1] and [2] above. Given that application of chronic BC water quality guidelines for protection of aquatic life in the receiving environment downstream of the discharge does not represent a regulatory requirement and instead data are intended to be assessed relative to monthly average concentrations, exceedances of these guidelines are highlighted for information purposes, but detailed interpretation of guideline exceedances are not provided given that an interpretation of monthly trends and consideration of background influences and discharge chemistry is required.

[4] **Bold and shaded text** outlines a reportable exceedance given that it exceeds the applicable BC water quality guideline (i.e., the short-term acute freshwater aquatic life guideline), or discharge concentration limit, consistent with recommendations outlined in Hatfield (2024).

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Bureau Veritas, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Bureau Veritas Calgary, 4000 - 19 St. , Calgary, AB, T2E 6P8
(2) DOC present in the sample should be considered as non-purgeable DOC. Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.
(3) "Total Hardness" was calculated from Total Ca and Mg concentrations and may be biased high (Hardness, or Dissolved Hardness, calculated from Dissolved Ca and Mg, should be used for compliance if available).
(4) Samples were filtered and preserved at the lab. Values may not reflect concentrations at the time of sampling.
For Dissolved > Total Imbalance: When applicable, Dissolved and Total results were reviewed and data quality meets acceptable levels unless otherwise noted.
(5) Total PAHs in Water include: Quinoline, Naphthalene, 1-Methylnaphthalene, 2-Methylnaphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Acridine, Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzo(b&j)fluoranthene, Benzo(k)fluoranthene, Benzo(a)pyrene, Indeno(1,2,3-cd)pyrene, Dibenz(a,h)anthracene, and Benzo(g,h,i)perylene.
(6) The CCME method requires pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the CCME holding time. Bureau Veritas endeavours to analyze samples as soon as possible after receipt.
(7) LEPH = EPH (C10 to C19) - (Acenaphthene + Acridine + Anthracene + Fluorene + Naphthalene + Phenanthrene)
HEPH = EPH (C19 to C32) - (Benzo(a)anthracene + Benzo(a)pyrene + Fluoranthene + Pyrene)
(8) TOC present in the sample should be considered as non-purgeable TOC.
(9) VPH = VH - (Benzene + Toluene + Ethylbenzene + m & p-Xylene + o-Xylene + Styrene)

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.
